ICE HASH MACHINES

ABM EQUIPMENT

Isolate and de-water trichomes in a single step.

Placed immediately after the rinsing/agitation tanks, this specialized solution uses a number of screening layers to remove unwanted plant material then capture trichomes and remove water. The stainless design is durable, easy to clean, and prevents egress.

Most commonly sold in standard small and large models (24”–40”), they’re available in sizes from 18”–100” for virtually any throughput.

Our US-made machines have a number of advantages over alternate offerings including but not limited to operational efficiency, ease-of-use, and CIP configuration. But the most important distinguishing property is the GAP-FREE design which improves performance and cleanability.

Reach out to our process engineers and techs for system design, integration, and 24/7 service.

Easily cleanable and exchangeable screens allow various configurations to be accommodated..
