

# WHOLE FLOWER SORTERS

***Sort buds automatically with a continuous-throughput solution that classifies up to 5 flower sizes.***

By passing buds over vibrating screens of increasing mesh, large buds are ejected from upper outlets while smaller buds pass through for further sorting. 18" to 100" diameter sizes are available for both low and high throughput, and screens sizes are easily exchanged. This allows a single unit to be used for multiple harvests and classifications.

Circular vibratory sorters are preferable to the original rectangular and manual models because of their large capacity and little need for supervision. The circular design maximizes surface-area utilization, is easier to clean, and minimizes the distance product must travel before being classified.

*Easily cleanable and exchangeable screens allow buds to be sorted in any number of sizes.*
